Separate Account Navigator | pilot blueprint

Four-week pilot: bounded, evidence-first

The demo is a static scenario engine. A production-like pilot replaces replayed analysis with permission-aware retrieval and model-generated proposals, while deterministic services enforce gates. Start read-only against approved source copies; activate sandbox writes only after approval records and idempotency are verified.

Layer	Concrete responsibility
Sources	Email attachments, approved briefs, IMA/policy versions, case histories, capability catalogue, holdings and setup evidence. Preserve original bytes and ACLs.
Evidence ingestion	Parse/OCR, classify, malware-scan uploads, hash versions, retain document/page/span references. Treat all document text as untrusted data; ignore embedded instructions.
Case reasoning	Extract schema-constrained facts; surface conflicting values; retrieve comparable cases with reasons and limits; draft risks, clarification questions and tailored tasks.
Deterministic controls	Required approvals, opportunity status, workstream dependencies, rule predicates, data freshness, same-revision approvals, no duplicate requests and maker/checker separation.
Human decisions	Legal interpretation, compliance coding, operational capability, client commitments, transition and funding authorization. IAM roles, delegated authority and review notes required.
Systems adapter	Appian orchestrates execution; financial account via existing Appian-to-SFDC integration. SharePoint or approved repository stores evidence; Aladdin/CSTAR/other systems only through approved APIs or controlled handoffs.
Audit	Append-only records of source hash, model/prompt version, proposal, reviewer, decision, case revision, intended action and downstream acknowledgment.

No autonomous cross-system write

An approved plan produces a proposed action with an idempotency key such as case:revision:action. Re-check authority and current version at execution. Record acknowledgment and reconcile; retry only retryable failures and route stale/partial writes to Operations.

Delivery backlog and acceptance

Week	Deliverable / gate
1 - evidence & case model	Agree one region/strategy, owner matrix and approval gates. Collect 10-20 de-identified historical cases if permitted. Annotate field conflicts, source spans and true blockers.
2 - reasoning	Implement fact extraction, relevant case retrieval, risk cards and draft playbook. Every material claim links to evidence or is labeled an assumption; unresolved fields remain unknown.
3 - human decisions	Implement review, rejection, revision invalidation and testable guideline representations. Add read-only/sandbox system adapters and a proposed-action outbox.
4 - evaluation & rehearsal	Replay held-out cases plus changed-date and stale-data scenarios; review errors with Legal/FI PC/Ops; demonstrate blocked gates, recovery and approved sandbox handoffs.

Proposed pilot measures - targets to agree, not measured results

Extraction: exactness on mandate amount, currencies, dates and names; field-level evidence accuracy. Retrieval: specialist-rated analogue relevance and source coverage. Risk: blocker recall, false-positive burden and unsupported-claim rate. Workflow: attempted forbidden transitions must all remain blocked in control tests. Guideline conversion: specialist sign-off and passing boundary/missing-data/parent-map tests. Business: paired elapsed and hands-on time, exception loops, and review effort.

Evaluation design

Use held-out cases, not the cases used to author prompts. Separate model error from source incompleteness and unclear policy. Log denominator, reviewer agreement and confidence intervals where meaningful. A small four-week pilot cannot establish rare-failure safety or justify full autonomous operation.

Failure cases to test

Duplicate intake; conflicting signed/draft documents; missing final approval; stale ESG; unmapped issuer; unsupported reporting; wrong-role approval; approval after revision change; partial integration failure; malicious instructions embedded in a PDF; funding request before reconciliation.
