

Separate Account Navigator | presenter guide

A case worth showing

A fictional Swiss pension foundation awards Capital Group a USD 250m global investment-grade fixed-income separate account. It brings bespoke exclusions, mixed funding, CHF reporting and derivatives. The assistant builds a tailored route, explains risks using evidence and defers accountable decisions to people.

Client at a glance	Scenario
Client	Alpenridge Pension Foundation, Zurich; all parties and cases fictional
Initial / revised mix	USD 200m securities + USD 50m cash -> USD 170m securities + USD 80m cash
Date change	23 Nov 2026 -> proposed 9 Nov; derivatives estimated ready 16 Nov
Key decisions	Governance closure; restriction interpretation; reporting feasibility; transition; staged launch; final release
Presentation time	12-15 minutes; optional 5-minute executive path on page 7
Demonstration mode	Deterministic scenario replay. No live LLM, live connectors, authenticated approvals, real orders or actual client records.

Open with this

"Separate accounts share five broad stages, but the route depends on the client. This assistant reads the case, compares relevant history, surfaces a small number of consequential decisions, and shows what has to change when the client changes the request. The accountable teams remain in control."

What comes in this pack

13 source PDFs; a merged Source Pack; a machine-readable Scenario Data JSON; this guide; an implementation blueprint. The interactive site includes linked evidence, scenario controls, rule tests, role-based simulated decisions, readiness and an exportable audit trail.

GUIDE / DEMO PLAYBOOK

Separate Account Navigator | presenter guide | continued

1 | Intake and the initiation gate - 2 minutes

Open Case overview. Show USD 250m, CHF reporting, the initial funding mix, target and the four watch areas. Select Intake & evidence. Open D01 and D03.

"The email says the opportunity is won. The assistant extracts facts with source references but does not confuse a sales message with approval evidence. D03 shows a missing final IOR and open CORG conditions. It can prepare a draft, but formal initiation stays blocked."

Use Review decisions and try Initiate before closure. The button is blocked with the reason shown. In Intake & evidence select Load governance closure, which imports D10. Switch the simulated reviewer to GCS Operations, then initiate. Appian creates the synthetic Account Take On request; the Salesforce account appears only through the simulated integration.

Expected visible result

Gate changes from Needs evidence to Ready for Operations, then Initiated after the human action. Audit identifies the imported evidence and the reviewer. Governance clearance does not mark funding ready.

Why this is impressive

It finds a procedural omission before work fans out and preserves the team's actual initiation gate. It also recognizes that this is an institutional separate account: no CIT subscription form, recordkeeper assumption or Form 5500 dependency is inserted.

GUIDE / DEMO PLAYBOOK

Separate Account Navigator | presenter guide | continued

2 | A tailored plan and comparable history - 2 minutes

Open Adaptive playbook. Show the five broad phases and seven parallel operational workstreams. The timing ranges come from the supplied process images; case dates and estimates are synthetic. Click a source badge to inspect the evidence.

"The assistant retrieves prior cases because of specific shared attributes: CHF reporting, a restriction boundary, or mixed funding with derivatives. It explains the similarity and the limitations. It does not copy a historical approval or claim that the prior client's rule applies here."

Show the three analogue cards from D08 and the four prioritized watch areas. Explain that fixed business controls enforce gates while AI proposes the case-specific tasks and evidence requests.

Human control

One GCS Operations owner coordinates. FI PAG bridges relationship and investment teams. Legal and FI PC interpret and approve investment restrictions. Reporting confirms capability; PM/transition approves the transfer plan. Committee routing remains conditional on actual policy.

Do not overclaim

The implementation uses supplied process notes and a synthetic capability catalogue. No actual Capital Group system capabilities, historical cases, service levels or committee routing have been verified.

GUIDE / DEMO PLAYBOOK

Separate Account Navigator | presenter guide | continued

3 | Contract to tested restriction - 3 minutes

Open Restriction lab. Compare D04 clause 4.1 with D05 policy 2.1. Show the exactly-5% boundary. Before clarification, coal cannot be coded reliably.

"This is more than summarization. A single word changes which assets may enter the account. The assistant surfaces the conflict, drafts a question and waits for client and specialist review."

Load client clarification (D09). Review the proposed language: direct corporate holdings, approved parent mapping, tobacco $\geq 5\%$, thermal-coal extraction $\geq 10\%$; missing/unmapped/stale data goes to review. Set the boundary input below 5, at 5 and above 5. Show the difference between the original $>5\%$ and proposed $\geq 5\%$ rule.

Click Run portfolio screen. Twelve positions total USD 200m: Alder at 5% fails, Granite at 12% coal fails, Meridian is unknown. The other nine total USD 170m. Each corporate position is 4% of the full USD 250m mandate; sovereigns are exempt only from that concentration test.

Open Review decisions. As Legal approve contract interpretation; as FI PC approve candidate rule tests. Explain that the displayed rule is implementation-neutral and is not executable CSTAR syntax.

Expected visible result

No automatic rule promotion. Legal approval and FI PC approval are separately recorded. The analysis is illustrative as of 14 September; the final release uses the refreshed 6 November evidence in D13.

GUIDE / DEMO PLAYBOOK

Separate Account Navigator | presenter guide | continued

4 | Reporting and transition decisions - 2 minutes

Open Review decisions. Load client service agreement (D11). As Client Reporting approve the Tuesday weekly holdings / monthly attribution alternative. As Transition / PM approve retaining the three flagged holdings with the outgoing manager and substituting USD 30m cash.

"The assistant distinguishes a client request from an operational capability and explains the alternative in business terms. It also turns the restriction finding into a funding decision. The mandate stays USD 250m; the funding mix becomes USD 170m securities and USD 80m cash."

Open a drafted client follow-up and review it. The control copies or downloads a draft only; it does not send an email. Decisions capture reviewer role, current revision, evidence and a review note. Rejection leaves the gate blocked and creates a rework entry.

5 | The client changes the date - 2 minutes

From Adaptive playbook select Inject late client change. D12 requests 9 November. Derivatives are estimated ready 16 November. Show options: preserve full mandate on 23 November, or explore a 9 November bonds-only launch with derivatives deferred.

Choose Explore staged launch. The case revision changes, the plan adds staged-launch tasks and affected rule/mandate and transition approvals reopen. Reporting agreement remains valid because frequency/output did not change. New date acceptance is still required.

"The assistant does not just redraw a timeline. It identifies exactly which decisions are stale, keeps unaffected approvals, and requires the client and accountable owners to accept the revised scope."

Separate Account Navigator | presenter guide | continued

6 | Final readiness and post-funding - 2 minutes

In Review decisions, reapprove Legal, FI PC and Transition against the staged plan. Select the GCS Operations role and load the final readiness pack D13. The pack includes synthetic client/PM acceptance, executed-document receipt, specialist reviews, current guideline tests and setup acknowledgments.

As GCS Operations approve the staged launch. Open Funding readiness. Each workstream must show its required evidence; derivatives must show Disabled for staged launch, not Complete. Missing evidence or rejected decisions continue to block release.

Switch to Operations Checker. Record final simulated release. The application records a funding-release event only after current-revision approvals and evidence gates are met. Select Simulate funding receipt to replay D13 page 2 and reveal the post-funding checks.

"The assistant assembles the evidence and explains readiness. An independent checker authorizes the simulated release. Actual funding and trading would still go through existing controlled systems."

Finish with a tangible result

Open Systems & audit. Show Appian coordination, the Appian-to-Salesforce financial-account creation, linked document versions, proposed downstream setup and the immutable-in-production requirement. Export the local demo audit JSON.

"The value is fewer missed conditions, faster interpretation and less rework, measured with a pilot. We have not assumed that AI may approve legal terms, accept operational risk or move money."

Separate Account Navigator | presenter guide | continued

Five-minute executive path

Time	Action / message
0:00-0:45	Overview: USD 250m, four consequential watch areas; source-backed intake.
0:45-1:30	Restriction lab: >5% versus >=5%; load D09 and screen; USD 30m transition issue.
1:30-2:15	Adaptive playbook: seven workstreams, three relevant analogues with limitations.
2:15-3:15	Decision desk: reporting alternative and separated human approvals.
3:15-4:15	Inject late date request: 9 Nov conflicts with derivatives readiness; staged option reopens affected approvals.
4:15-5:00	Funding readiness and audit: source evidence + independent checker; no release on unresolved gates.

Rehearsal controls

Reset demo clears this browser's local scenario state. Use the Presenter notes view to follow the full sequence. The current reviewer selector is a demonstration of decision rights, not secure authentication. Refreshing the page retains only device-local demo state when browser storage is available.

If time is short, show a blocked funding gate rather than pretending all approvals have happened. All source PDFs and the case data can be downloaded from the evidence view.

Handling questions

"Is AI live?" No, this deliverable is a deterministic demonstration; the blueprint describes the live-AI pilot. "Are these CG policies?" Only workflow structure is taken from your screenshots; capability limits and client facts are invented. "Can it send or trade?" No external write is connected. "What if it is wrong?" Evidence, abstention, specialist review and deterministic gates prevent an unsupported model recommendation becoming an approval.

GUIDE / DEMO PLAYBOOK

Evidence map and known gaps

Material supplied	How used / limitation
Meeting-summary screenshot	Five-part structure, historical risk guidance, tailored playbooks and contract-to-rule use case. It is a summary, not a full verbatim transcript.
Process image 01	Pre-vetting, CORG, DAG/IOR and required templates; unclear owners remain explicit assumptions.
Process image 02	Initiation, single GCS owner, Appian/legacy execution and Appian-to-SFDC account creation; first four workstreams.
Process image 03	Remaining workstreams and Legal tasks: IMA, fee, derivatives, tax, AML, third-party forms.
Scenario additions	Swiss foundation, USD 250m, dates, capability constraints, all names, precedents, source documents and approvals are synthetic.

Confirm with Capital Group before a live pilot

Exact contracting entity and institutional product scope; regional legal obligations; definitive DAG/IOR/CORG applicability; the unresolved owner rows in current process; recordkeeping and document system of record; permitted connectors and APIs; guideline-engine semantics; data licensing; actual service calendars; identity/approval segregation; audit-retention policy; approved client communications.

No fabricated ROI

Use a baseline case sample to measure time spent collecting evidence, clarifying restrictions, coordinating exceptions and preparing readiness packets. Compare AI-assisted and manual work with blind specialist review; track missed blockers and unsupported recommendations. No improvement percentage in this demo is a measured Capital Group result.
